

Where is Zika? Here's a map

Declan Selleck
22 August, 2016

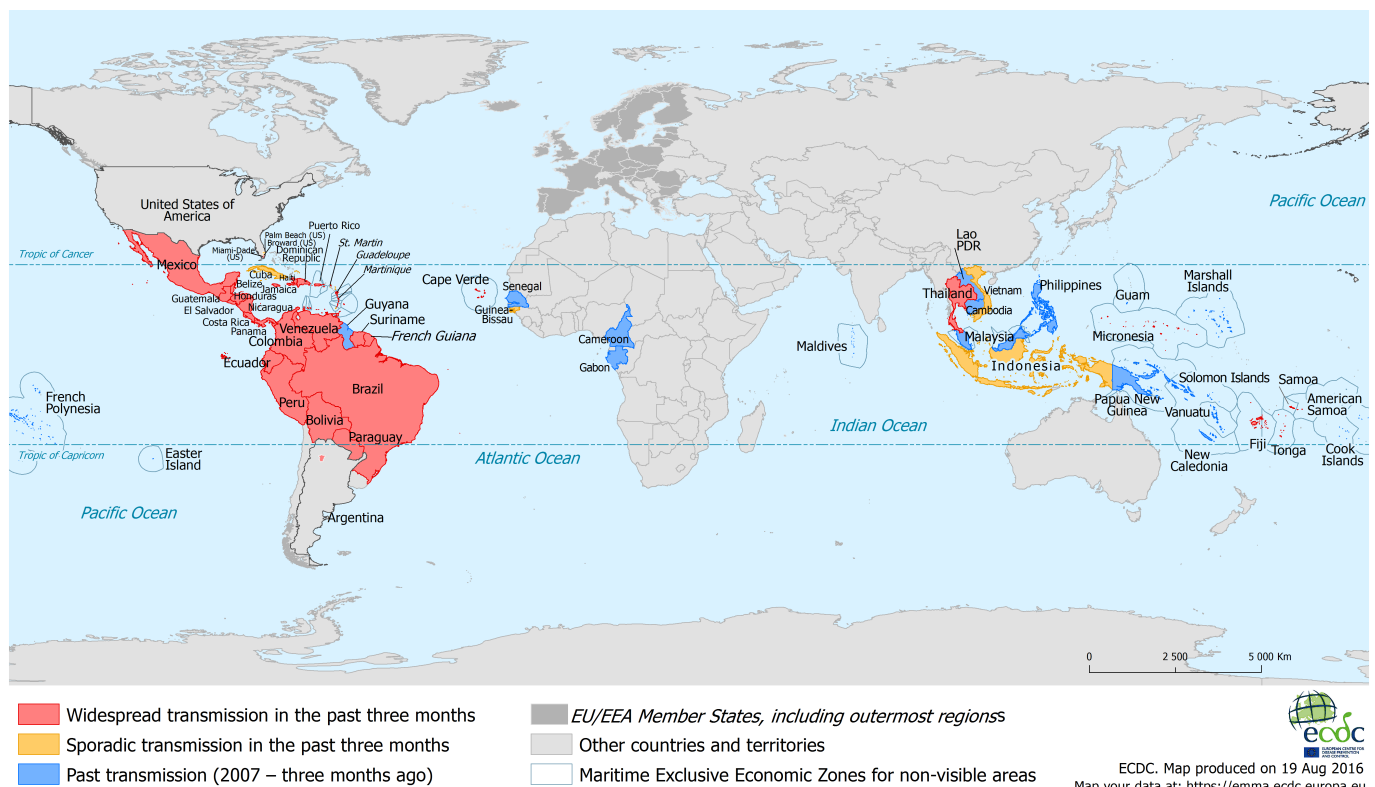

We just came across this – and it's a very useful, current map, of where the Zika virus has been found. A few weeks back, we reported that Zika was on the decline, thanks to winter in South America and a declining mosquito population. Turns out, that optimism was premature.

This map shows where Zika is, as of 19 August 2016.

Sporadic transmission: No more than 10 locally transmitted cases have been reported in a single area within this time period.

Increasing or widespread transmission: More than 10 locally transmitted cases of Zika virus are reported in a single area, OR at least two separate areas report locally transmitted cases of Zika virus, OR Zika virus transmission is ongoing in an area for more than 3 months.

Past transmission: Local Zika virus transmission has been reported since 2007 – but not in the past three months. –
